Rehabilitation Centre

Project: Accessible school and Rehabilitation

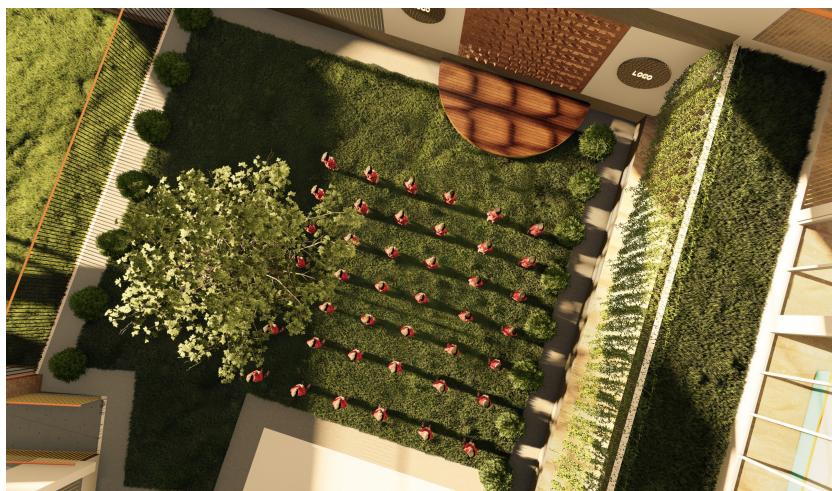

Location: Kerala, India

This project involved designing a special school with accessible, universal design principles. My role included initial conceptualization, floor plan development, renderings, and presentations. I worked closely with the Architect, ensuring the design respected the site's contours and blended seamlessly with its tropical modernist aesthetic and natural landscape. I also led site visits, client meetings, and managed project presentations for the government and local stakeholders. This project highlights my skills in accessibility-focused design, concept development, presentation preparation, and public project management. While ongoing, it remains a valuable learning experience in civic design.

The basement floor is designed with Therapy Units, Waiting Rooms, Meeting Rooms, and Doctor's Rooms for those not staying at the center. This area is easily accessible from the outside, providing convenience for visitors.

The ground floor includes five Classrooms, a Staff Room, a Medical Room, and wide Transitional Spaces for easy movement. Additionally, Ramps and Lifts are provided carefully to ensure accessible movement between floors.

The first floor features a Conference Hall, Smart Classroom, and R&D Library. The second floor includes areas for Housekeeping, Staff, Meditation, Vocational Training, and a Leisure Area with a Gym, Gaming Area, and Turf.
